

Sony Group's Initiatives for Responsible AI

Sony established the Sony Group AI Ethics Guidelines in September 2018, aiming to utilize artificial intelligence (AI) to contribute to a peaceful and sustainable society while delivering 'kando'—a sense of excitement and wonder.

The guidelines support responsible AI through seven core commitments:

1. Supporting creative lifestyles and building a better society through sustainable and culturally enriching AI applications.
2. Engaging stakeholders proactively to address challenges and share ethical considerations across business units.
3. Ensuring safety and trust in AI-integrated products and services, accounting for statistical uncertainties and potential risks.
4. Protecting user privacy and personal data with compliance to laws, policies, and user expectations.
5. Promoting fairness and respect for diversity and human rights, with an emphasis on eliminating discrimination.
6. Pursuing transparency by explaining AI-driven decisions and impacts in customer-facing products.
7. Advancing AI through ongoing education, research, and talent development aimed at fostering ethical AI.

Sony's AI Ethics Committee (est. 2019) and AI Ethics Office (est. 2021) provide oversight and expertise, while assessment mechanisms track AI deployments across product development cycles.

Sony supports responsible R&D through tools like Neural Network Console and Prediction One, incorporating explainability (XAI) and fairness principles. Open-source initiatives and academic publications further reinforce this mission.

Additional principles on human rights, quality, and privacy protection are embedded in the Sony Group Code of Conduct and aligned with ethical AI deployment across business sectors.
